

Three-minute narration

Project owner: Shivam Gupta

Read the large text verbatim. Timing labels are not spoken. The current hosted demo uses a disclosed generic synthetic narrator. This script can also be read by Shivam. It describes the verified Databricks publication and the Firebase interface.

0:00 to 0:20 / Closure decision

A hawker centre closes for repairs. The notice gives a date. A community coordinator still has to decide where support is needed and what the budget can achieve. HawkerBridge turns that notice into a reviewable decision. The project is owned by Shivam Gupta.

0:20 to 0:55 / Access and cleaning scenario

On September twenty-eighth, seventeen centres have scheduled closures. At an eight-hundred-metre threshold, six subzones lose nearby hawker coverage at their representative points. Those areas contain about ninety-one thousand Census twenty-twenty residents. That is a screen for investigation, not a count of people going hungry. Walking barriers and other food options still need checking. A coordinator can compare a cleaning-date change before funding support. The official schedule stays unchanged.

Now consider five-percent participation, four dollars per meal, three hundred dollars to set up each collection locality, and capacity of a hundred and fifty meals per locality. With fifteen hundred dollars, the planner allocates two hundred and twenty-five meals across two proposed localities. These locations and capacities still need an operator's verification.

At three thousand dollars, planned capacity reaches four hundred and fifty meals. Double the budget to six thousand, and it stays there. Three localities times a hundred and fifty meals is the ceiling. Proposed spending is twenty-seven hundred dollars. That is the useful decision: verify more capacity before seeking more funding for this arrangement.

1:55 to 2:14 / Save and export a draft

Save the proposal with its assumptions and source evidence. Inspect the local review checklist, then export a coordination brief. Nothing here books a venue or dispatches food.

2:14 to 2:54 / Databricks evidence and pilot

Behind the interface, Databricks preserves the source data in governed tables, quarantines ambiguous dates, and records nine scenario comparisons in MLflow. This public application runs through Firebase and uses that verified data publication. The results are modelled decisions, not measured social impact. The next test is one operator and one scheduled closure: measure preparation time, verify every proposed venue, and learn whether the workflow earns repeat use. HawkerBridge makes that decision visible, testable and reviewable.
