

Neighbourhood continuity plan

2026-09-22 | DRAFT | One-day planning proposal

Proposed support requires verification of demand, accessible routes, a suitable venue and a licensed operator. No service has been booked or dispatched.

ASSUMED MEALS / DAY	PLANNED COST / DAY	CANDIDATE LOCALITIES
225	S\$1,500.00	2

Allocation rationale

For 2026-09-22, 14 subzones lose a listed hawker centre within 800 m under this model. Assuming 5.0% participation, the scenario requires 19,520 meals. This plan allocates 225 meals across 2 proposed collection localities for S\$1,500.00 per day. Meal allocations favour areas with a higher senior share, subject to the chosen budget, site capacity and reach. A coordinator must verify real demand, a suitable venue, accessible routes and operator capacity before acting.

Proposed collection localities

Locality / area	Meals	SGD / day
Clementi Woods Clementi	92	668.00
Lavender Kallang	133	832.00

Decision assumptions

Budget S\$1,500.00/day. Setup S\$300.00/site/day. Meals S\$4.00 each. Capacity 150 meals/site/day. Participation 5.0% of census residents in flagged subzones. Maximum 3 sites. Reach 800 m straight line. Senior preference multiplier 2. These inputs are assumptions.

Estimated demand under these assumptions: 19,520 meals/day. Unallocated demand: 19,295. Unspent budget: S\$0.00. Solver: optimal.

Before implementation

Confirm actual resident demand and dietary needs. Secure accessible premises and permissions. Confirm an operator, staffing and safe food handling. Recheck official closure dates. Agree a contact, delivery schedule and a way to record uptake and unused meals.

Evidence and limitations

Exposure means loss of a nearby listed hawker centre, not measured hunger or food insecurity.

Distances are straight-line estimates from subzone representative points, not walking routes or wheelchair access.

The model covers listed hawker centres only. Coffee shops, food courts, home cooking and delivery are outside its coverage.

Census residents are aggregated geographically. The model does not locate or identify individual residents.

Absence of a published closure is not confirmation that a centre or its stalls are operating.

Resident and senior counts are Census 2020 observations, not 2026 population estimates; published counts are rounded.

Subzone locations are polygon representative points, not homes or population-weighted centroids. Distance is a spatial screening proxy.

NEA stall counts measure infrastructure, not operating stalls, spare meal capacity, demand or observed footfall.

Missing/TBC and staggered block closure intervals are quarantined, so scheduled-open means no resolved full-centre closure recorded, not a guarantee.

The closure calendar is a current 2026 schedule with some older works retained; it is not a complete historical closure archive and has no reliable permanent-closure labels.

Food-waste data are annual national totals covering all sectors. No centre-level waste or causal intervention outcome is observed.

URA boundaries are from Master Plan 2019; geometry is simplified only for display and is not a pedestrian routing network.

Only NEA-listed hawker centres are included; coffee shops, food courts and other meal providers are omitted.

Meal uptake, daily setup cost, per-meal cost and site capacity are editable assumptions, not measured or quoted values.

Collection localities are candidate geographic points, not confirmed available premises. No provider or venue has agreed to deliver this plan.

Senior weighting is a policy preference applied to aggregate demographics, not an estimate of individual vulnerability.

Sensitivity holds allocations fixed. Potential surplus is a meal-count scenario, not an estimate of measured food waste.

Model: hawkerbridge-1.0.0. Generated: 2026-09-22T04:26:19.098445+00:00.
